

1st Quarter 2021 Consumer Price Index Report

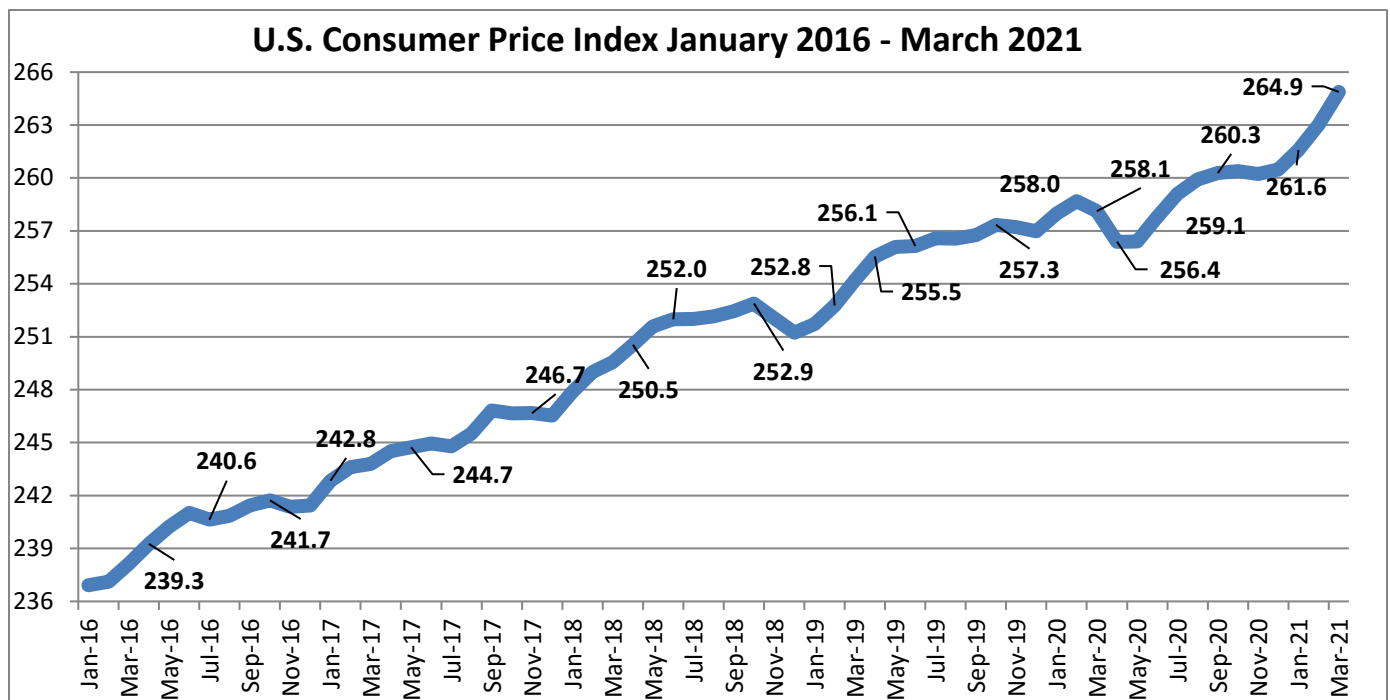

May 2021

Executive Summary

The Consumer Price Index (CPI) is a measure of the average change over time in the prices paid by American consumers for goods and services. The Consumer Price Index is measured by the U.S. Bureau of Labor and Statistics and reported monthly and is often used as a measure for cost of living and economic conditions. The CPI is based on prices of food, clothing, shelter, and fuels, transportation fares, charges for doctors' and dentists' services, drugs, and the other goods and services that people buy for day-to-day living. Each month, prices are collected in 87 urban areas across the country from about 4,000 housing units and approximately 26,000 retail establishments--department stores, supermarkets, hospitals, filling stations, and other types of stores and service establishments.

The 1st Quarter average Consumer Price Index (US City Average) increased to 263.2 from its 260.4 level last quarter. Monthly CPI has generally been trending upwards since November 2016 but experienced periodical declines in December 2017, 2018 and 2019. With the exception of the fourth quarter of 2018 and the 2nd quarter of 2020, quarterly CPI average has been trending upwards since the 4th Quarter of 2015, when the index was at 237.2. The decline in 2020 was mainly due to the partial shutdown of the US economy from the COVID19 pandemic. Those lower prices will have an exaggerated effect on growth if prices resume its natural trend pre-pandemic. With the increase in consumer demand and the limitations in supplies due to the pandemic, supply chain limitations and other factors prices may continue to rise as the economy returns to normal. The current 2% to 3% goal for the Federal Reserve is still within range, but the Federal Reserve will look for signs that point to an overheating economy.

The yearly levels keep trending upwards: 2020 annual average CPI rose to 258.8, compared to the 2019 average of 255.7 and 2018 average of 251.1. The current YTD inflation rate is at 1.7% with a 263.2 YTD average CPI.

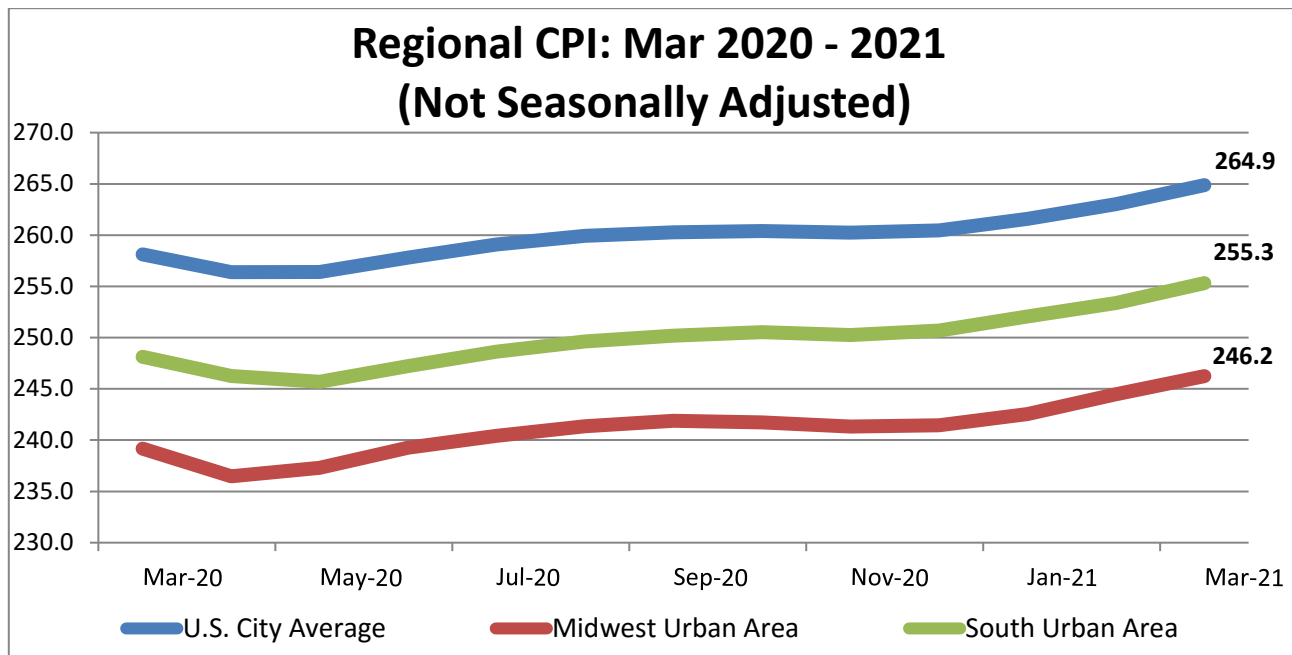

U.S. City Average **Not Seasonally Adjusted** – March 2021 – 264.9

Regional Consumer Price Index

Oklahoma is the most northwestern state in the Southern region, as defined by the Bureau of Labor Statistics. Oklahoma shares many characteristics with the Midwest region, given that it is in such close proximity. The South region is comprised of: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia. The Midwest region is comprised of Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

The Midwest and the South Urban Areas' CPIs increased by 2.96% and 2.89%, respectively, over the 12-month period, while the national CPI increased 2.62%. Supply-chain disruptions, energy/fuel disruptions and the Coronavirus were major contributory factors to the recent surge CPIs across the nation.

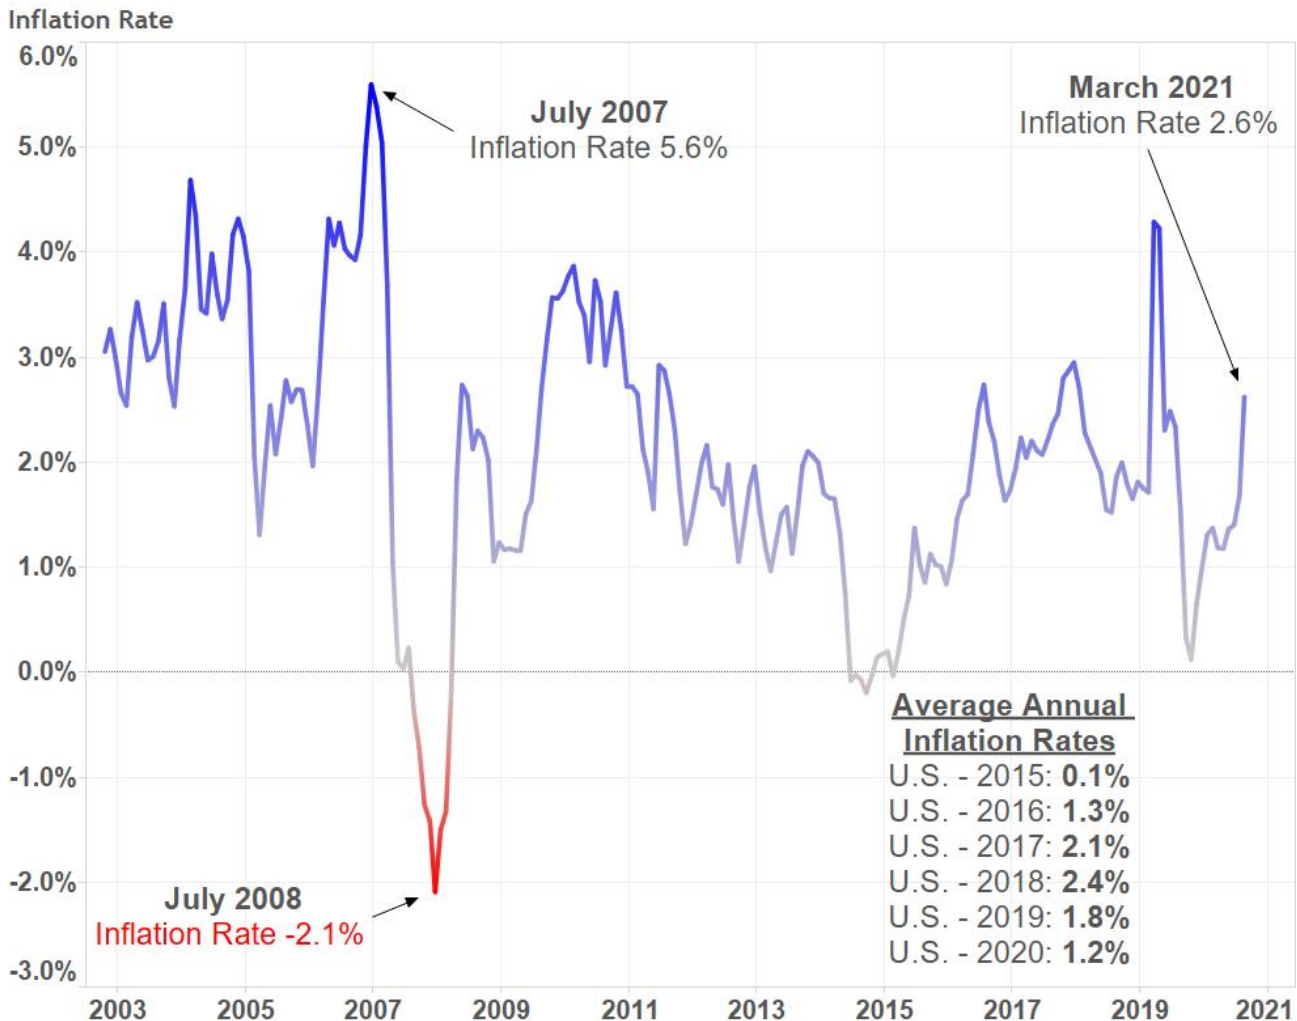

The graph below shows a 12-month moving average for the U.S., as well as the South and Midwest Regions.

12-Month Moving Average: **U.S.** – 260.0, **Midwest Urban Area** – 241.2, **South Urban Area** – 250.0

Inflation Rate (Month over Month)

The inflation rate is a measure of the rise in the general price levels of goods and services over a period of time. The chief measure of price inflation is the percentage change in the Consumer Price Index.

Observations:

From late 2015 to the present the US has not seen any deflation, but the Federal Open Market Committee's target of two-percent inflation was only hit once in 2016. Moving forward in 2017 and 2018, meeting the 2% goal proved to be more successful. Inflation was over the 2% mark for most months in 2017, and remained above 2% throughout 2018, until December. 2019 resulted in a reintroduction of inflation rates below the 2% target; averaging 1.2% during in 2020. As the economy recovers and business start getting back to normal there will be significant pressure to raise prices. There will be upfront costs build facilities and re-establish supply-chain networks that were broken or left fragile. Businesses will watch how prolonged these pressure remain, and disruptions such as natural disasters and attacks on energy supply could keep prices higher while the country is recovering from the pandemic.

Methodology: The graph above illustrates month-over-month inflation levels using the U.S. City Average measure of the CPI. For example, the March 2021 inflation level of 2.6% was calculated by comparing the CPI of the preceding March (2020) to the March 2021 figure.
